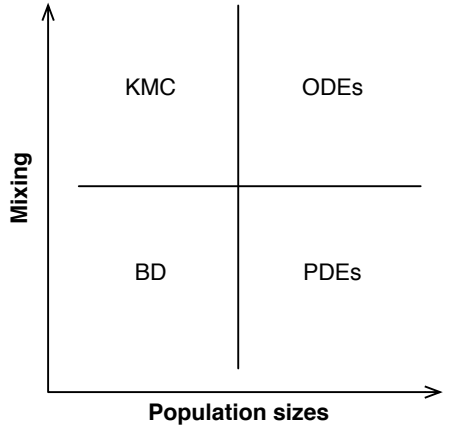
What is rule-based modeling?

- **A modeling approach based on the principles of chemical kinetics**
- **An approach distinguished by its means of model specification: local rules vs. equations**
- **An approach based on assumptions of modularity – the interaction represented by a rule depends on molecular context only as explicitly specified in the rule**
- **An approach useful for studying biomolecular site dynamics in cell signaling systems (e.g., changes in levels of phosphorylation at individual pTyr sites)**

There's an RBM equivalent for many traditional modeling approaches



Outline

1. **The motivation for modeling, and rule-based modeling in particular**
2. Basic concepts of rule-based modeling
3. Indirect and direct methods for simulating a model

The need for predictive models of cell signaling systems

- **These systems mediate cellular information processing and decision-making (regulation of cellular activities and fates)**
- **These systems are complex**
- **Molecular changes that affect cell signaling cause/sustain disease (e.g., cancer)**
- **Numerous drugs that target signaling proteins are currently in clinical trials**
  - Successes (e.g., imatinib treatment of CML)
  - But results are disappointing for many patients
- **Many clinical trials are underway to test combinations of drugs (clinicaltrials.gov)**
  - There are too many combinations to consider all possibilities in trials
  - Targeted therapeutics can have counterintuitive effects (e.g., BRAFi)

Cell signaling behavior depends on quantitative properties

PERSPECTIVES

The Response of Cancers to BRAF Inhibition Underscores the Importance of Cancer Systems Biology

Edward C. Stites[*†]

Clinical Translational Research Division, The Translational Genomics Research Institute, Phoenix, AZ 85004, USA.

† Present address: Department of Pathology and Immunology, Washington University School of Medicine, 660 South Euclid Avenue, St. Louis, MO 63110, USA.

Abstract: The BRAF inhibitor vemurafenib has become an important treatment option for melanoma patients, the majority of whom have a BRAF(V600E) mutation driving their malignancy. However, this same agent does not generally benefit colon cancer patients who have the BRAF(V600E) mutation. Recent work suggests that BRAF(V600E) inhibition by vemurafenib results in decreased negative feedback to the epidermal growth factor receptor (EGFR) pathway and that the different clinical responses are due to differences in the amount of EGFR present in these two cancers. The experimental work that identified the feedback signaling was an elegant mix of functional genomic approaches and focused, hypothesis-driven cellular and molecular biology. The results of these studies suggest that combined treatment of BRAF(V600E)-driven colon cancers with both vemurafenib and EGFR inhibitors is worth clinical evaluation.

What's the value added by modeling?

- **We can use models to organize information about a system with precision**
  - Introduces greater rigor and discipline
  - Discovery of knowledge gaps
- **We can determine the logical consequences of a model specification**
  - Design principles can be elucidated (key for intuitive understanding and perhaps synthetic biology)
  - Ranking of clinically available therapies for a given patient (key for personalized medicine)

A signaling protein is typically composed of multiple components (subunits, domains, and/or linear motifs) that mediate interactions with other proteins

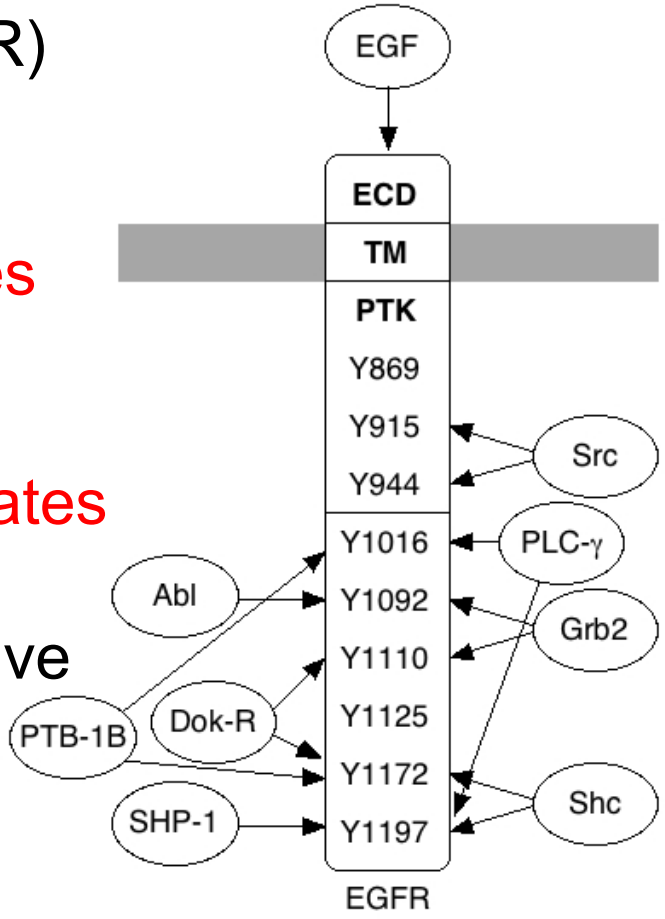
Combinatorial complexity

Epidermal growth factor receptor (EGFR)

9 sites => 2^9=512 phosphorylation states

Each site has ≥ 1 binding partner
=> more than 3^9=19,683 total states

EGFR must form *dimers* to become active
=> more than 1.9×10^8 states



CC is a serious problem for the textbook approach: why

A

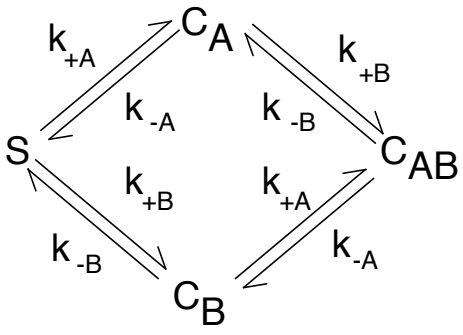
$$A + S \underset{k_{-A}}{\overset{k_{+A}}{\rightleftharpoons}} C_A$$

$$B + S \underset{k_{-B}}{\overset{k_{+B}}{\rightleftharpoons}} C_B$$

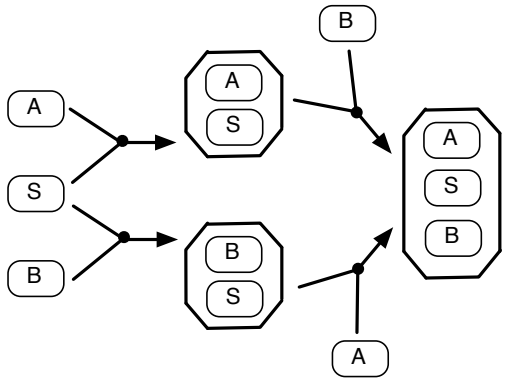
$$A + C_B \underset{k_{-A}}{\overset{k_{+A}}{\rightleftharpoons}} C_{AB}$$

$$B + C_A \underset{k_{-B}}{\overset{k_{+B}}{\rightleftharpoons}} C_{AB}$$

B



C



D

$$\frac{dx_1}{dt} = k_{-A}x_4 + k_{-B}x_5 - k_{+A}x_1x_2 - k_{+B}x_1x_3$$

$$\frac{dx_2}{dt} = k_{-A}x_4 - k_{+A}x_1x_2$$

$$\frac{dx_3}{dt} = k_{-B}x_5 - k_{+B}x_1x_3$$

$$\frac{dx_4}{dt} = k_{+A}x_1x_2 + k_{-B}x_6 - k_{-A}x_4 - k_{+B}x_4x_3$$

$$\frac{dx_5}{dt} = k_{+B}x_1x_3 + k_{-A}x_6 - k_{-B}x_5 - k_{+A}x_5x_2$$

$$\frac{dx_6}{dt} = k_{+B}x_4x_3 + k_{+A}x_5x_2 - k_{-B}x_6 - k_{-A}x_6$$

Chylek et al. (2013)

Network (model) size tends to grow nonlinearly (exponentially) with the number of molecular interactions in a system when molecules are “multi”

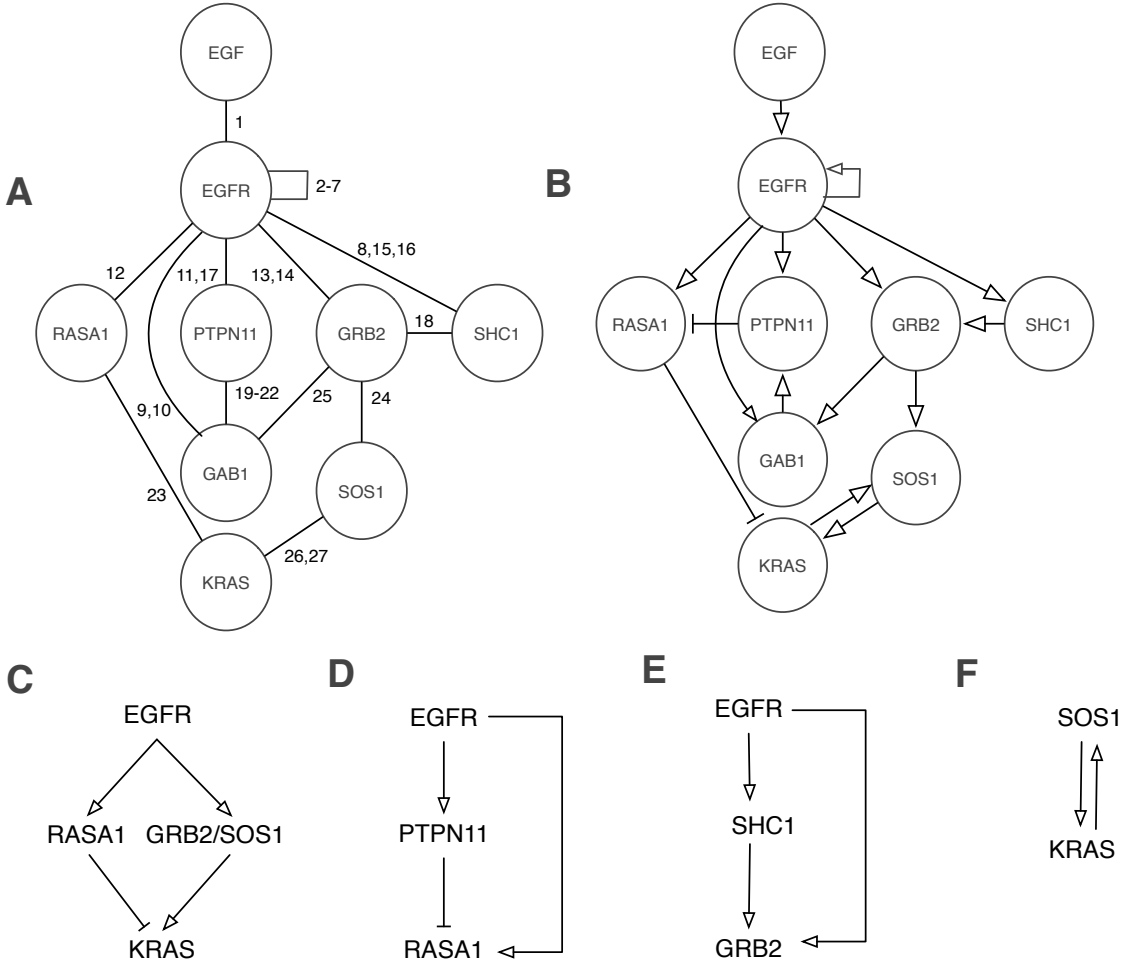
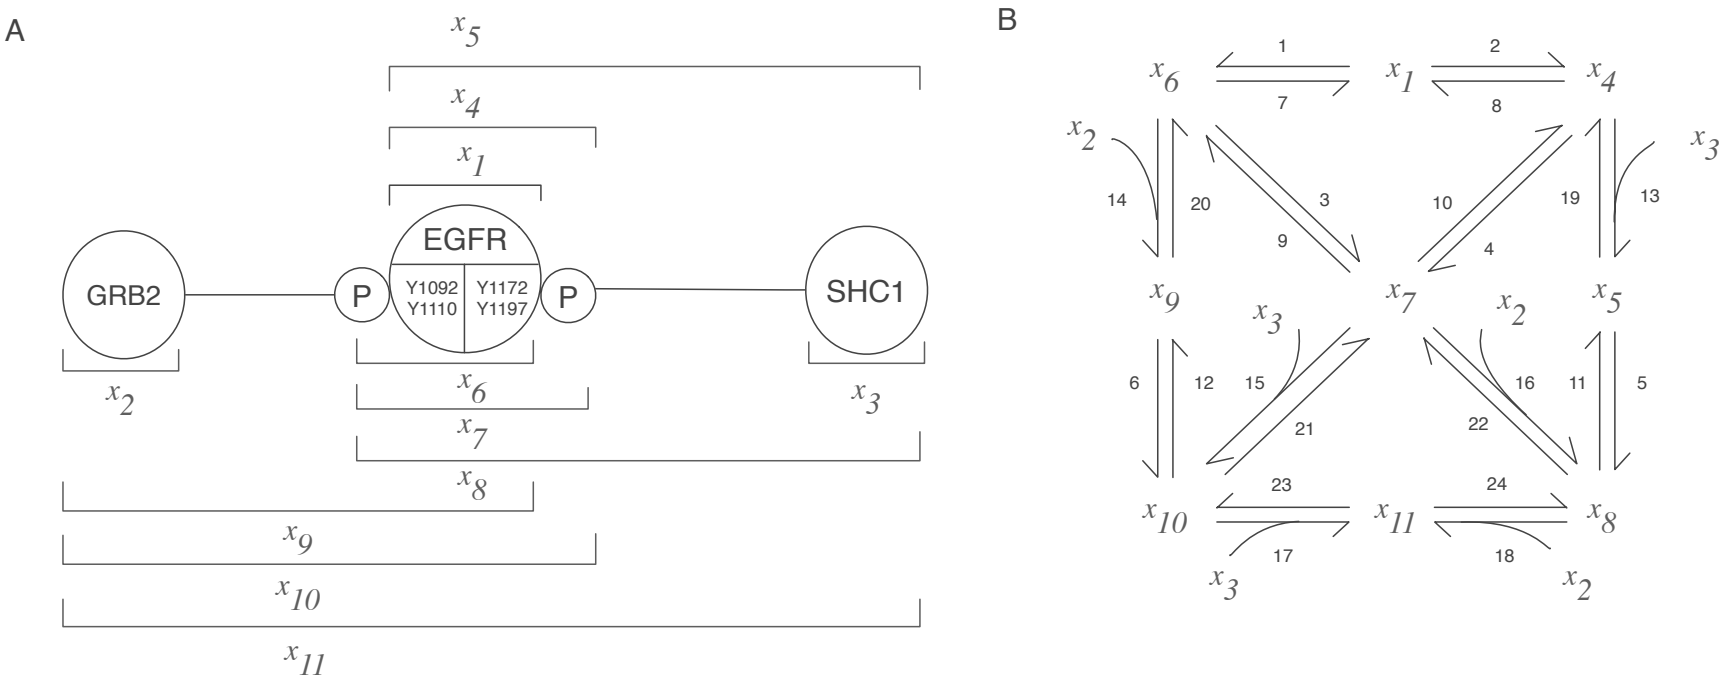
Chylek et al. (2013)

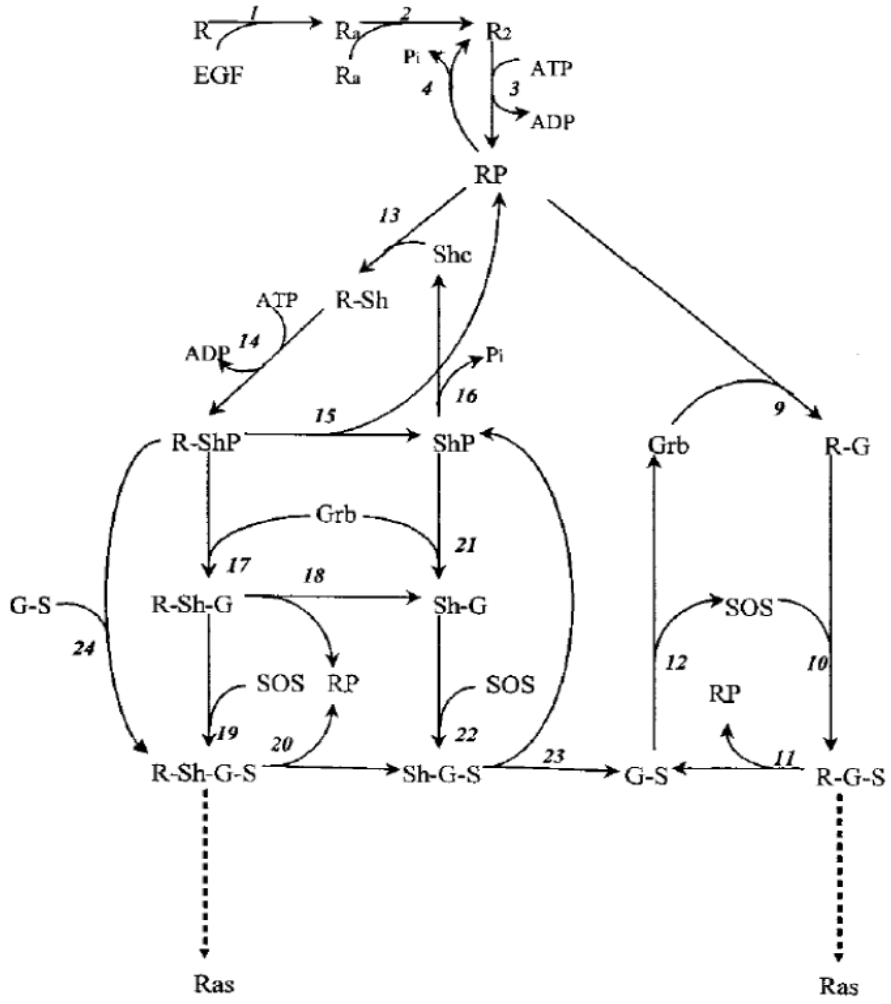
A typical representation of a cell signaling network



The edges of a typical network graph hide considerable complexity



If you can write the model by hand, it may look like a mechanistic model, but it's probably just a complicated fitting function



A reaction scheme incorporated in numerous published models for EGFR signaling

Kholodenko et al. (1999)

The problem of combinatorial complexity

- **Inside a Chemical Plant**
  - Large numbers of molecules…
  - …of a few types
  - Traditional state variables (concentrations) can be measured.
  - Traditional modeling of chemical kinetics, developed before the existence of molecules was widely accepted (starting in 1865), works.
- **Inside a Cell**
  - Possibly small numbers of molecules…
  - …of myriad possible types (more than a googol, easily)
  - Traditional state variables CANNOT be measured – no data.
  - What do we know? Most studies are focused on elucidating the “rules” of interactions, meaning the parts of biomolecules responsible for interactions and the contextual constraints on interactions. Can we use this information more directly?

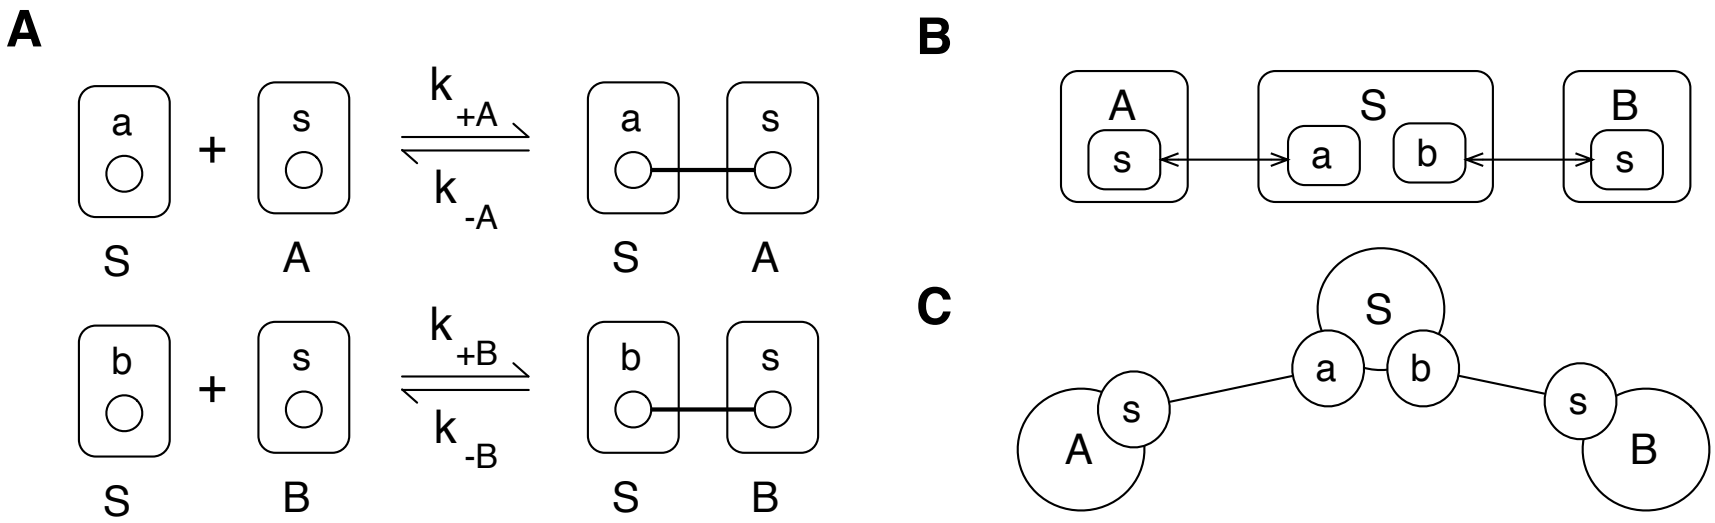
Outline

1. The motivation for modeling, and rule-based modeling in particular
2. **Basic concepts of rule-based modeling**
3. Indirect and direct methods for simulating a model

Rule-based modeling: basic concepts

Use graphs represent molecules and their component parts and "internal states"

Formalize interactions as graph-rewriting rules



A “language” is used to encode graphs and and graph-rewriting rules in plain text

Listing 1

```
begin molecule types
S(s,a,b)
A(s)
B(s)
end molecule types
begin seed species
S(s,a,b) S_init
A(s) A_init
B(s) B_init
end seed species
begin reaction rules
S(a) + A(s) <-> S(a!1).A(s!1) kpa,kma
S(b) + B(s) <-> S(b!1).B(s!1) kpb,kmb
S(s) + S(s) <-> S(s!1).S(s!1) kps,kms
end reaction rule
```

BNGL

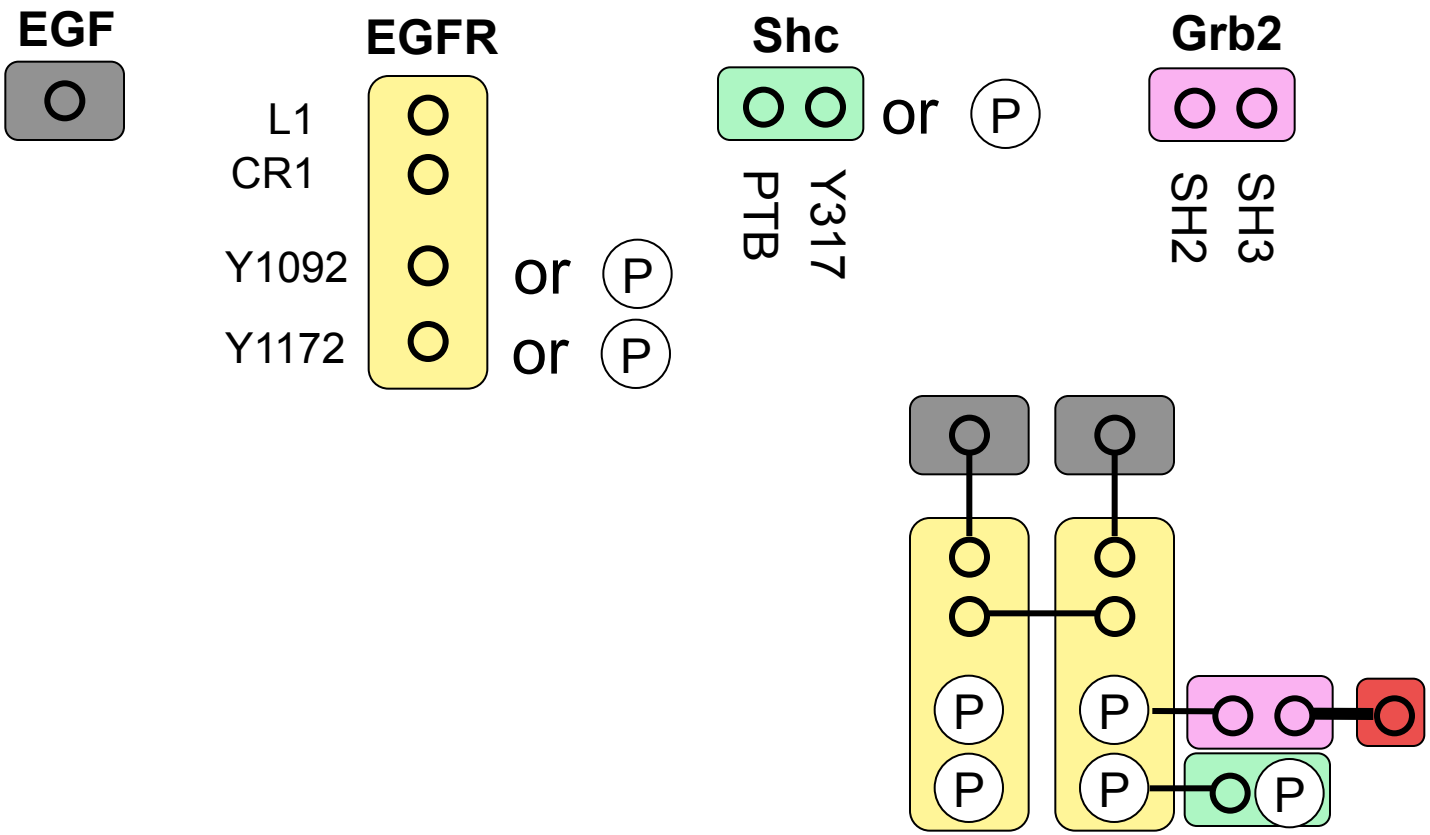
IGF1(ds!1,hs!2).IGF1R(S1!1,Y1346~P).IGF1R(S2!2) kpY1346
```

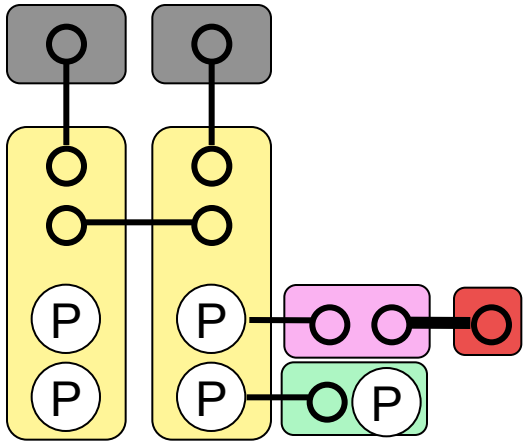
Code example from Chylek et al.

Representing molecules



Blinov ML et al. (2006) *BioSystems*

Representing complexes: connected sets of graphs for molecules

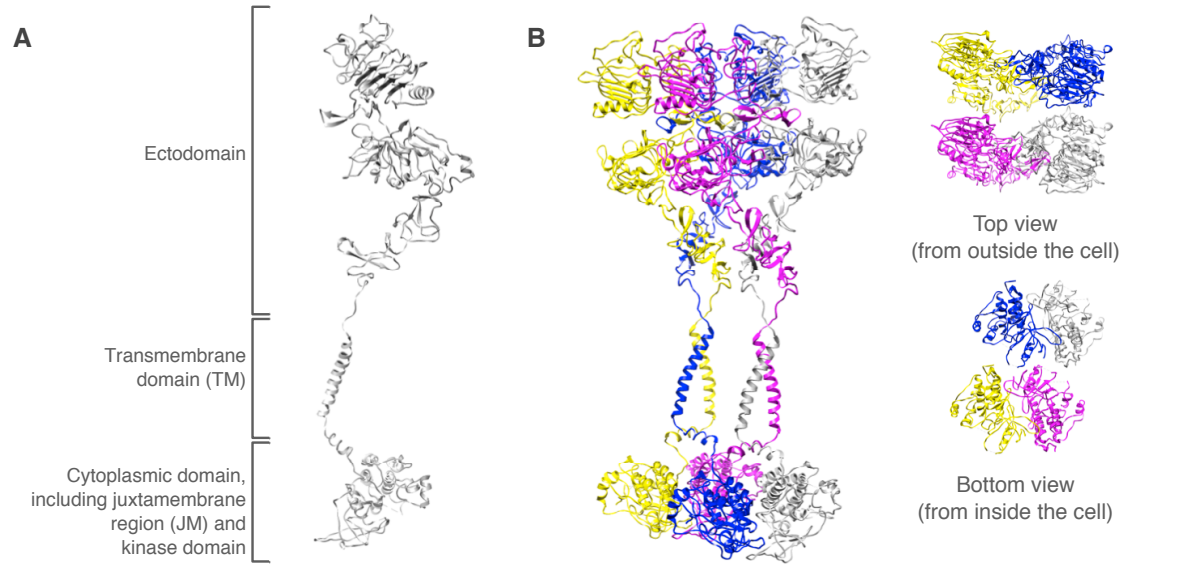


No need to introduce a unique name (e.g., X_{123} or ShP-RP-G-Sos) for each chemical species, as in conventional modeling

Edges represent bonds between components

Bonds may be intra- or intermolecular

The granularity of molecule representation: intermediate between atomic and traditional state variable representations



D `EGF(rec)`

E `EGFR(lig,back,cd~c~o,Y~u~p)`

F

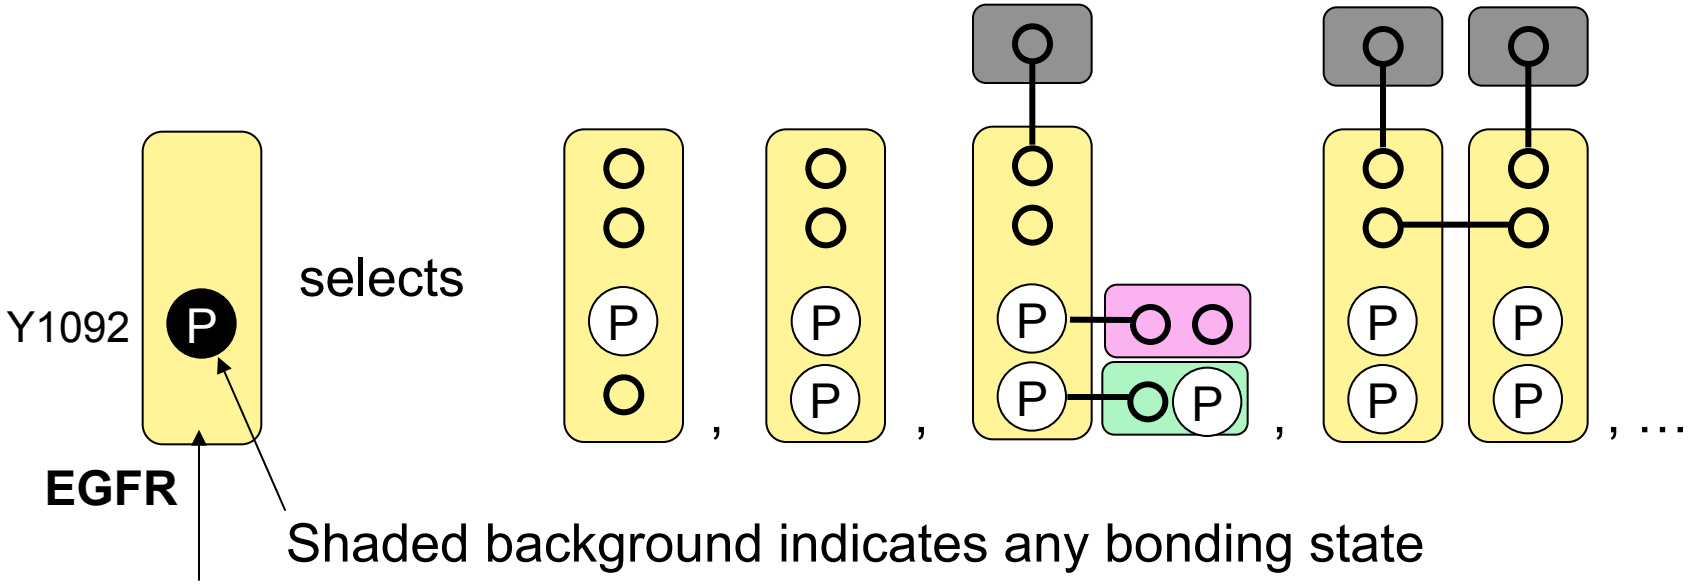
```
EGF(rec!5).EGFR(lig!5,back!1,cd~o!4,Y~p).\
EGF(rec!6).EGFR(lig!6,back!1,cd~o!3,Y~p).\
EGF(rec!7).EGFR(lig!7,back!2,cd~o!3,Y~p).\
EGF(rec!8).EGFR(lig!8,back!2,cd~o!4,Y~p)
```

Kozer et al. (2013) Mol BioSyst

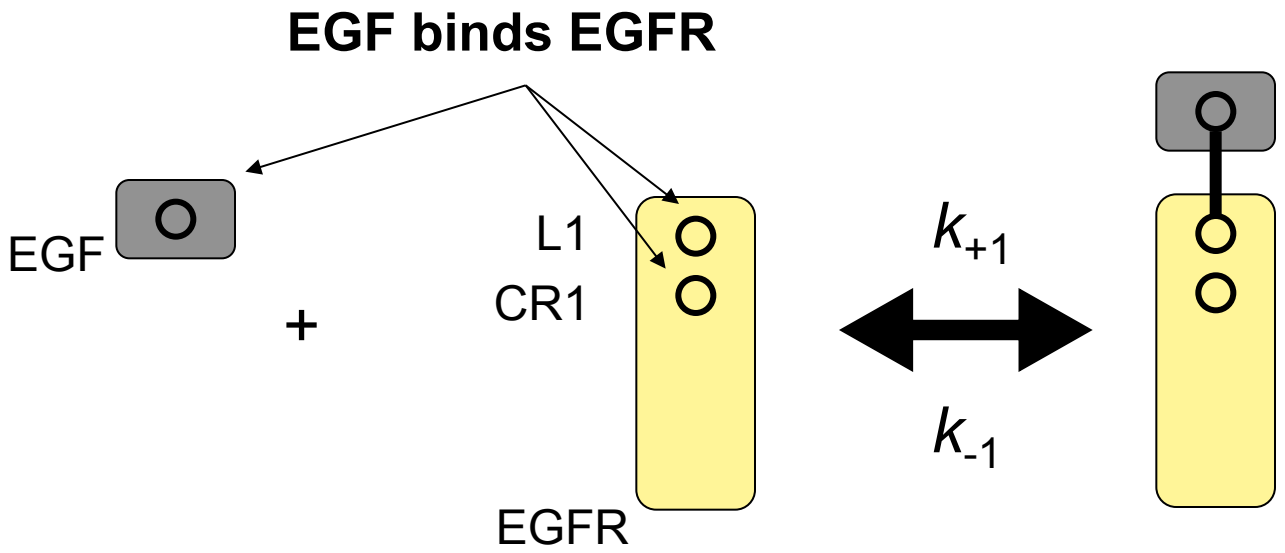
L.A. Chylek & C.-S. Tung

Representing interactions: patterns (subgraphs) define sets of chemical species with common features

A pattern that matches EGFR phosphorylated at Y1092



Representing interactions: rules are composed of patterns



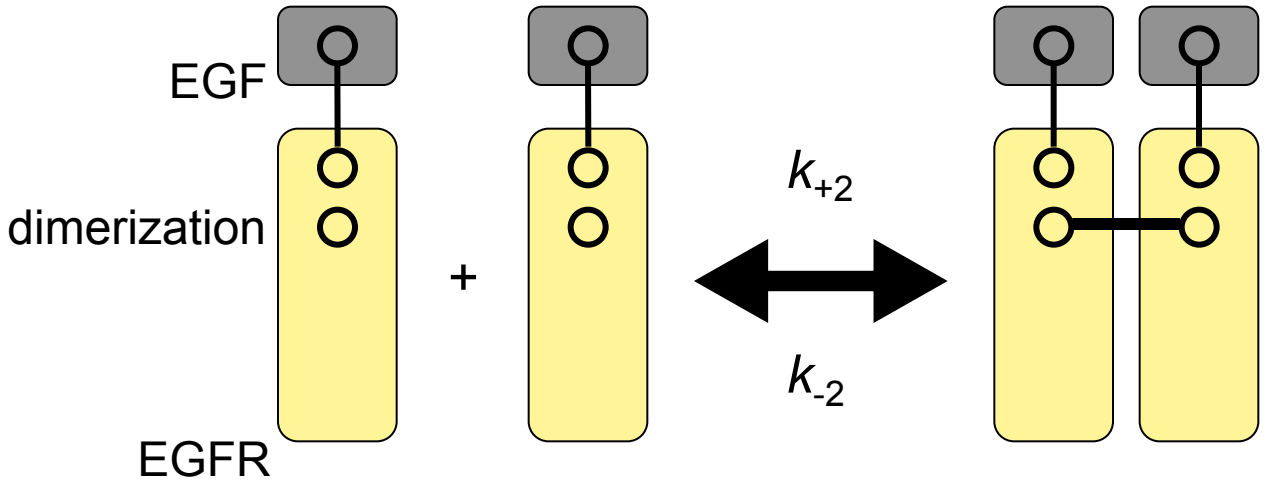
```
begin reaction rules

 EGF(R)+EGFR(L1,CR1)<->EGF(R!1).EGFR(L1!1,CR1)

end reaction rules
```

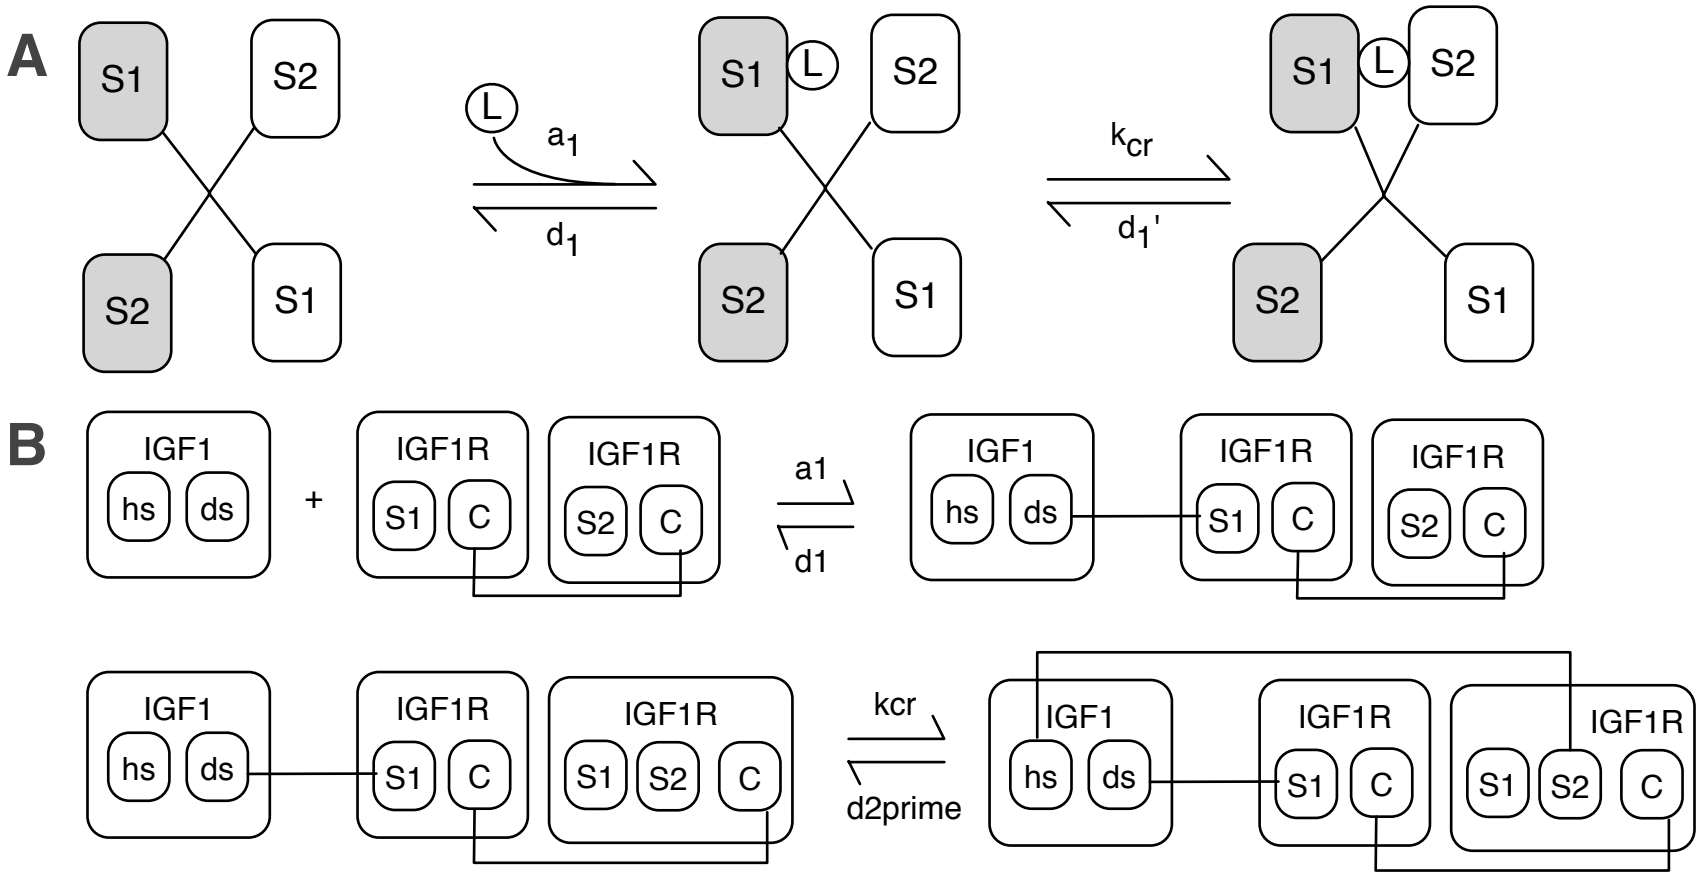
Dimerization rule

EGFR dimerizes (600 reactions are implied by this one rule)



No free lunch: According to this rule, dimers form and break up with the same fundamental rate constants regardless of the states of cytoplasmic domains, which is an idealization.

Another example of how to represent interactions (part 1)



Kiselyov et al. (2009) Mol Syst Biol; Chylek et al. (submitted)

Another example of how to represent interactions (part 2)

C

```
begin molecule types
IGF1(ds,hs)
IGF1R(S1,S2,C) # monomer
end molecule types

begin seed species

Network-free (direct) simulation

Particles

The transformation of the rule is applied, which generates a new system state

Los Alamos
NATIONAL LABORATORY
EST. 1943

Conclusions

- To capture the physicochemical dynamics of a cell signaling system, a coarse modeling approach (vs. an approach like MD) is required, one based on the principles of chemical kinetics, because relevant time scales are s to min.
- Traditional approaches for modeling chemical kinetics are difficult to apply if one is interested in complex mechanisms (anything except idealized small circuits) – why is this surprising?
  - To formulate an ODE model, one must enumerate the chemical species that are populated – astronomical numbers of chemical species can potentially be populated (so not all are important) but there is no data available to guide identification of the important species
- Descriptions of protein interactions in the biological literature can be viewed as descriptions of "local rules," which can be formalized to specify models for biomolecular site dynamics.
- Rule-based models can be simulated using indirect or direct methods
  - Indirect = derive equiv. model in trad. form + apply std. simulation algorithm
  - Direct = use rules as event generators (requires unconventional definition of system state)
